CORN PRODUCTION IN ILLINOIS, 1928-1939

- By Counties -

In the 12 years ending in 1939 corn yields per acre ranged from 21.5 bushels in 1934, the lowest since 1887, to the record high of 52.0 in 1939. The main factors contributing to this extreme variation have been climatological conditions and the introduction of the use of hybrid seed. Four of these years (1932, 1937, 1938, and 1939) were nearly ideal corn producing years with hybrid seed used to increasing degrees in 1937-1939; four (1928, 1929, 1931, and 1935) were average corn years; and four (1930, 1933, 1934, and 1936) were drought years with 1934 and 1936 each classed as worse than any year previous. Planted acreage varied in these 12 years from 7,883,000 acres in 1934 (the smallest since 1874) to 9,817,000 in 1931 and 1932 (the largest since 1917).

In 1937 about 15 percent of Illinois' corn acreage was planted to hybrids compared to 45 in 1938, 66 in 1939, and a further increase in 1940. Prior to 1937 the acreage planted to hybrid seed was negligible.

Yields of 43.0 bushels per acre in 1932, 48.0 in 1937, 45.0 in 1938, and 52.0 in 1939 were due largely to excellent growing seasons. Excepting 1938, the yield in each of these years established a new high record. Other factors contributing to the high level of yields starting in 1937 were the increasing use of hybrid seed, the use of better lands for corn, and improved fertility resulting from soil conserving practices. In the four poor corn years, yields were affected adversely by drought, extreme heat, and insects. The 1936 growing season was the driest and the hottest on record; however, the early season supply of soil moisture was better than in 1934.

The planted acreage ranged around 9 million acres from 1928 through 1930 and increased to 9,817,000 acres for 1931 and 1932, the largest since 1917. Due to the wet spring and poor yields in 1933, also low prices received for the 1931, 1932, and 1933 crops, coupled with the Agricultural Adjustment Administration program, the planted acreage was decreased by 1934 to the lowest since 1874 and increased only slightly in 1935. The increased acreage in 1936 and 1937 was offset by decreases in 1938 and 1939. Harvested acreages of corn were the same as the planted acreages given in this publication except in 1934 and 1936 when abandonment amounted to 78,000 acres and 94,000 acres respectively.

Production estimates given on the following pages are in terms of equivalent grain production on total corn acreage harvested for all purposes.

The information in this bulletin is an attempt to meet the increasing demand for county data of corn grown in Illinois. The Illinois Cooperative Crop Reporting Service, Illinois and Federal Departments of Agriculture, publishes herein county estimates of acreage, yield per acre, and production of corn in Illinois for the years 1928-1939 inclusive. These estimates are based upon data from the U. S. Census, Agricultural Adjustment Administration, the Illinois Assessors' Census, 1937-1939 inclusive, and returns from regular and special lists of cooperators and the rural carrier surveys.

A. J. Surratt,

Senior Agricultural Statistician.

Prepared by
Clarence E. White.
